1 ADMONISHMENTS

The admonishments are the symbols and wording used in this manual to alert readers to specific dangers and instructions. The meanings of the various admonishments are explained as follows:

Warning = risk to life or personal injury and equipment damage

Caution = risk of equipment damage.

= risk of electrical shock potentially causing death or injury.

= alert of risk potentially causing death or injury.

= risk of burn injury from hot surfaces

= an alert that must be understood and undertaken.

= instruction of mandatory reading of product manual.

= risk of electrostatic damage to components. Proper precautions must be taken.

= access for children prohibited.

= restricted access area.

= tip over hazard.

2 SAFETY

All installation and maintenance must be carried out by suitably qualified personnel.

For your protection, the product manual should be read and thoroughly understood before unpacking, installing and using the equipment.

The energy manager contains static sensitive components that require careful handling and proper precautions to be taken. A grounding strap should be worn.

The equipment is intended only for use in a restricted access area. The equipment is not suitable for use in locations where children are likely to be present.

3 RECEIVING INSTRUCTIONS

Enatel provides all equipment to the delivering carrier securely packed and in perfect condition. Upon acceptance of the package from Enatel, the delivering carrier assumes responsibility for its safe arrival. Once the equipment is received, it is the recipient's responsibility to document any damage the carrier may have inflicted, and to file the claim promptly and accurately.

NOTE: the period to make a claim against damage by a transport carrier can be short, a matter of days, and varies by transport method, the transport contract, and local laws.

3.1 Package Inspection

Examine the shipping crate or carton for any visible damage: punctures, dents and any other signs of possible internal damage.

Describe any damage or shortage on the receiving documents and have the carrier sign their full name.

3.2 Equipment Inspection

Open the crate or carton and inspect the contents for damages. While unpacking, be careful not to discard any equipment, parts or manuals. If any damage is detected, call the delivering carrier to determine the appropriate action. They may require an inspection.

NOTE: Save all the shipping materials for the inspector to see.

After the inspection has been made, if damage has been found, contact Enatel. We will determine if the equipment should be returned to our plant for repair or if some other method would be more expeditious. If it is determined that the equipment should be returned to us, ask the delivering carrier to send the packages back at the delivering carrier's expense.

If repair is necessary, we will invoice you for the repair so that you may submit the bill to the delivering carrier with your claim forms.

It is your responsibility to file a claim with the delivering carrier. Failure to properly file a claim for shipping damages may void warranty service for any physical damages later reported for repair.

3.3 Handling

Handle the equipment with care. Do not drop or lean on front panel or connector. Keep away from moisture.

3.4 Identification Labels

Model number and serial number are clearly marked on all equipment. Please refer to these numbers in all correspondence with Enatel. Ideally provide a photograph of the product label for reference.

4 SCOPE

This manual covers essential information for the installing and commissioning of the standard Enatel DC System FlexiCompact 1 and 2 where the significant difference between the systems is the number of rectifier shelves, and comes in two variants – with front and rear connect AC.

NOTE: System set-up for the controller, power modules and other ancillary devices are provided in separate manuals. Where appropriate these are supplied with the system.

IMPORTANT: this is a generic manual for the standard configuration of the FlexiCompact. Should this manual not cover any part of the functionality of your system please refer to accompanying documentation. Or please contact your Enatel representative or info@enatel.net for further information as required.

5 SYSTEM OVERVIEW

The FlexiCompact a standardised DC system offered in 4 variants:

- Flexi1 with front and rear AC input options
- Flexi2 with front and rear AC input options

Where the Flexi 1 and Flex2 are differentiated by the number of rectifier shelves. See Table 1.

Table 1: System Models

Model	Rectifier Shelves	AC Connection
FLEXI1-BLK001	1	Rear
FLEXI1-BLK002		Front
FLEXI2-BLK001	2	Rear
FLEXI2-BLK002		Front

Customer specific options can be leveraged from this chassis, however these are outside the scope of this manual.

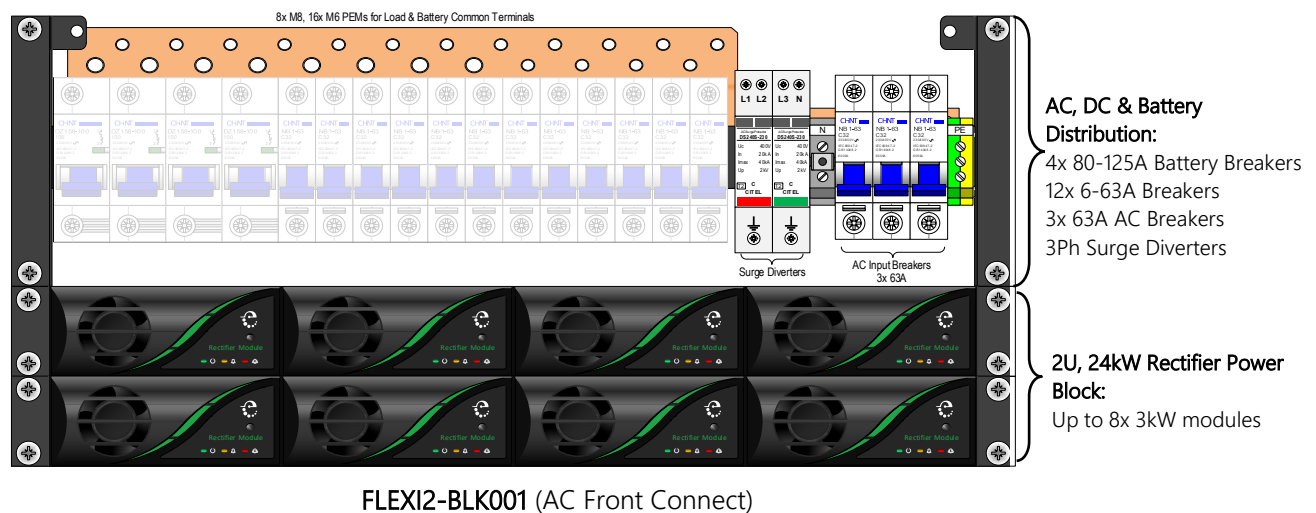

The system is intended to be a complete power system in a box with no connections needed to be made internally. The system is designed to be extremely simple to install and set up.

All DC connections are made from the front of the unit, while AC connections are made from either the front or the rear of the unit depending on the model. Alarm connections are also accessible from the front by opening the hinged front cover.

By adding smart distribution modules, the system can be customised to suit most requirements whilst maintaining a robust and smart user experience. Please contact your Enatel representative for assistance should customisation be required.

NOTE: the system is supplied with the AC and DC earths connected. The standard system output has the DC Common in the positive side of the circuit (+ve earth system).

Figure 1: FLEXI2 (fully optioned – FLEXI1 has the equivalent breaker quantity options)

5.1 Power System

5.1.1 Standard Features

The base unit is supplied with the following standard options:

- AC Input:
 - Three Phase:
 - Y 3Ph+N
 - Ph-N 220V
 - Ph-Ph 380-400V

Note: alternative AC configurations are available for engineered-to-order (ETO) systems

- DC Output: Nominal voltage: 48V DC (contact Enatel for other voltage options)
- EM4x energy manager system controller (fully integrated in the system)
- Battery Low Voltage Disconnect (300A and 500A rating)
- CTO (configurable to order) Options:
 - AC input MCB with surge protection device, type 2
 - 4 x DIN style 27mm battery MCBs
 - Front AC Connect: max of 12 x DIN style 18mm load MCBs
 - Rear AC Connect: max of max of 18 x DIN style 18mm load MCBs
 - Low voltage battery disconnect (LVBD) and low voltage load disconnect (LVLD) options

5.1.2 Current Capacities

- flexi1 system capacity is up to 240A with a maximum of 4x RM3048HE power modules
- flexi2 system total combined output current (Battery + Load) is 480A, with a maximum output current of 420A for load, plus 60A for batteries, with a maximum of 8x RM3048HE power modules

5.1.3 Optional Features

Additional options that can be specified at the time of order:

- AC input MCB with surge protection device, type 2
- 2 or 4 x DIN style 27mm battery MCBs
- Max. of 12 x DIN style 18mm load MCBs
- 300A or 500A load low voltage disconnect for Non-Priority Load
- I/O board
- AC monitoring including voltage, frequency and current
- Fan control
- Battery control monitoring
- Battery fuse fail
- Site monitoring
- Additional I/O support

NOTE: additional options can be added but installation outside of the factory is beyond the contents of this manual. Please consult your Enatel sales representative for more details.

5.1.4 Physical Dimensions and Weights

Table 2: FlexiCompact dimensions and weights

Model	FLEXI1-BLK001 (rear AC access)	FLEXI1-BLK002 (front AC access)	FLEXI2-BLK001 (rear AC access)	FLEXI2-BLK002 (front AC access)
Depth (Total)	436mm	410mm	436mm	410mm
Width (Total)	483mm (19" mount)	483mm (19" mount)	483mm (19" mount)	483mm (19" mount)
Height	180mm (4U)	215mm (4U)	224mm (5U)	259mm (5U)
Weight without rectifiers	14.0kg	14.1kg	17.5kg	17.8kg
Weight with max. rectifiers	18.5kg	18.6kg	26.5kg	26.8kg

* Maximum weights are indicated approximated based all possible configuration options included, subject to change.

5.2 Energy Manager

5.2.1 EM4x-01 Interface

Figure 2: 3U EM4x-01 Front Panel Interface

IMPORTANT: all system and module documentation can be accessed via the micro-USB port on the front panel of the energy manager.

5.2.2 Alarms and Status Indicators

- Status LEDs:
 - Red LED Urgent alarm state.
 - Orange LED Non-Urgent alarm
 - Green LED DC power is connected to the unit; Energy Manager is functioning

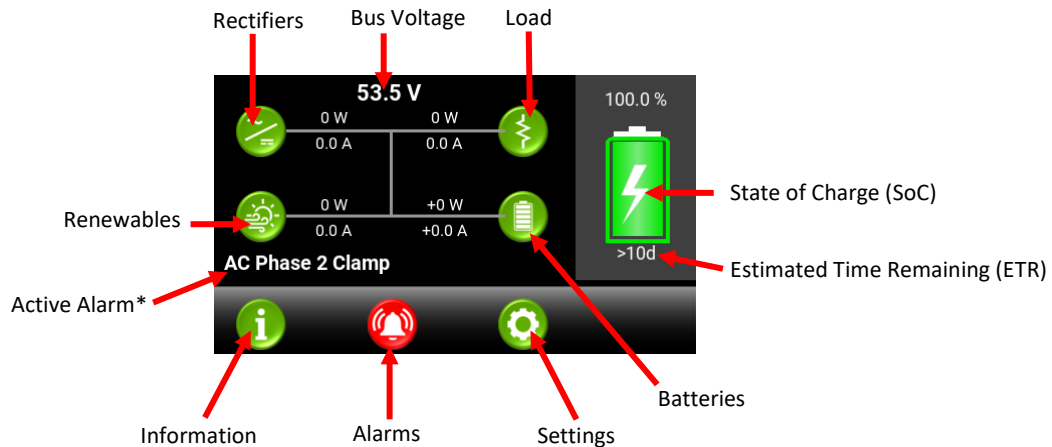

NOTE: The LED mapping can be user modified.

- The energy manager is fitted with an audible buzzer which can be configured to alert to any alarm depending on the alarm mapping.

NOTE: To disable the buzzer when active, tap the screen.
- Micro-USB Connector: can independently power the EM4x and provides access to the Web UI

5.2.3 Energy Manager 3U Touchscreen

Figure 3: Energy Manager 3U Touchscreen

***NOTE:** when there are multiple alarms raised the Active Alarm display cycles through the list. The complete list can be viewed by tapping Alarms.

Tap the touchscreen to navigate through the menus.

NOTE: the EM4x-01 has the option to PIN lock function change through the front screen interface. See the EM4x manual for details.

5.2.4 EM4x Features

The EM4x monitors all power system conditions including DC voltage, rectifier current, battery current, battery temperature, distribution failure; reporting and logging status. It has an in-built web based configurator allowing setup of system parameters, monitoring, updating and download of logs using a web browser as well as a front panel interface through which key parameters are also configurable. Visual notification of alarm conditions is given by LEDs and a display mounted on the front of the EM4x, with remote notification being enabled by relay contacts, RS232 or TCP/IP (using SNMP).

The EM4x utilizes a USB communications port which allows for local monitoring of system operations as well as pre-commission and power down configuration of the Web UI.

The EM4x also incorporates the following features:

- Support for Enatel's energypak battery modules with optimized battery backup functions
- Support for third-party external batteries, both lead-acid and lithium based
- Support for AC-DC rectifiers (24V, 48V, and 60V Outputs)
- Support for DC-DC converters (12V, 24V, 48V and 60V Outputs)
- Support for Enatel's range of solar and wind converter modules plus associated inverters
- Support for Enatel's range of ancillary devices including fan controllers, AC metering and battery monitors
- Control of up to two low voltage disconnects (magnetically-latched contactors) per I/O board*
- Network connectivity (web access)
- System voltage metering for primary system DC supply. (e.g. 48V primary DC output)
- Load, battery and rectifier current metering and alarms
- Active rectifier and converter current share
- Automatic system voltage control
- Effectively unlimited alarm thresholds as standard, for use with multiple DC outputs
- Advanced monitoring, display and logging of energypaks, and system performance data
- Advanced hybrid site control and monitoring with patented anti-stall feature for generators.
- Phase balance controls for multi-phase and single phase AC input management
- Sophisticated programmable logic control
- Grid tariff optimization – the ability to program schedules for battery assumption of load during peak grid tariff rates

- For lead-acid external batteries -
 - Battery and room temperature metering and alarms (when fitted with optional temperature sensors)
 - Optional complete or battery mid-point monitoring (when fitted with optional battery monitor cards)
 - Temperature compensation of float voltage (when fitted with optional temperature sensors)
 - Manual equalise charging to prolong the life of the batteries
 - Periodic equalise charging to prolong the life of the batteries
 - Fast charging after battery discharge
 - Battery capacity remaining indication
 - Battery testing facility
 - Battery current limit
- Six user defined General Purpose Inputs ("GPIPs") which can be software configured as either digital or analogue inputs* (up to 10 may be made available under special circumstances)
- Six relay outputs*
- I/O Expansion card capability*
- Expanded serial and CAN communications – up to 5 I/O boards can be connected to a single EM4x

* **Note:** the addition of an I/O Expansion card to the EM4x allows for analogue inputs and increases the number of digital inputs and relay outputs available. The controller allows for these new inputs/outputs to be logically combined allowing a degree of control of peripheral functions. E.g. a temperature triggered room fan or humidity detection.

5.3 Rectifier Modules

Figure 4: RM3048HE Rectifier

The RM3048HE is a telecommunications grade rectifier with the following features:

- High efficiency
- Hot pluggable
- Forced air cooled
- Thermally protected
- Power factor corrected
- Wide input AC voltage
- Constant power output limit
- Input/Output voltage and current protected
- Active load sharing
- Serial alarm and control interface
- Microprocessor controlled

There are 3 LED indicators on the front panel which indicate the operational state of the rectifier:

Red LED	Urgent alarm state.
Yellow LED	Non-Urgent alarm.
Green LED	DC power is connected to the unit. This LED flashes during power save mode.

6 INSTALLATION

WARNING All upstream AC, Load and Battery breakers must be switched OFF prior to installation. The system must be completely de-powered.
All circuit breakers in a Flexi Compact system: the Load Breakers and Battery Breakers, must be in their OFF position prior to installation.

WARNING Use extreme care when fitting batteries & their connections. Remove all conductive materials from yourself such as watches, jewellery and rings prior to commencing the installation. DO NOT short terminals when working on them.

CAUTION Avoid resting cables on sharp edges (cold-creep)

The energy manager contains static sensitive components that require careful handling and proper precautions to be taken. A grounding strap should be worn.

6.1 Required Tools

Insulated M6, M8 pozi Screwdriver, insulated 0.6mm x 2.5mm diameter flat head screw driver, Insulated M10 bolt wrench/ratchet set and as required depending on set up available.

6.2 Suitable Racks

Recommended rack size is 19" and minimum 600mm deep.

6.3 Unpacking

Upon unpacking, check that the unit is not damaged, and that you have the required number of modules and blank panels (if and as appropriate for your system).

NOTE: Do not fit rectifier modules until the Flexi compact system has been installed into the rack.

6.4 Installing the Flexi System

STEP 1: Mount the system in the cabinet or rack as appropriate.

STEP 2: Connect the AC supply.

Undo the front thumb screws of the front panel of the FlexiCompact system and fold down to allow unrestricted access to the AC breakers for front AC connect systems.

Terminate the cables to the input circuit breakers and the terminal blocks for Earth and Neutral.

NOTE: the AC terminals accept up to 16mm² cables.

Figure 5: AC Termination

AC Front Termination

AC Rear Termination

NOTE: the AC earth terminal is connected directly to the system chassis.

Figure 6: AC Earth Termination

NOTE: AC and DC EARTHING - This system has a built-in AC to DC earth connection. No extra AC to DC earth link cable is required. Should this link be removed the warranty will be voided. Please check with Enatel should this link be required to be removed.

NOTE: if optioned the earthing cable from the chassis earth stud to the cabinet should now be installed.

STEP 3: Mount the AC terminal cover for front connect AC variants.

Mount the AC terminal cover to protect against contact with the incoming AC voltages.

1. Insert the AC terminal cover into the slots provided in system top cover for front connect AC.

Figure 7: Mount the AC terminal cover

2. Lower the terminal cover into position.

NOTE: check the washer provided is between the securing nut and the plastic cover.

Figure 8: Lower the AC terminal cover

3. Tighten the securing nut to lock the cover into position.

Figure 9: Lock the AC Terminal Cover

NOTE: the incoming AC cable can be secured to the top cover by cable tie to provide strain relief.

STEP 4: Connect the Load.

Load Common (+ve): all load common connections are made to the connectors placed behind the circuit breakers. 2 sizes of common terminals are available, up to 16mm² and 35mm².

NOTE: cables smaller than 6mm² should be terminated to the 16mm² connectors to make sure of adequate clamping force.

Load Live (-ve): Load Live cables are connected directly to the terminals at the top of the circuit breakers. Load breaker terminals are sized to accept cables up to 16mm².

Load distributions that include a secondary load LVD (LLVD) are split into 2 sections to allow prioritisation of the connected loads. Non-priority loads are removed from circuit prior to the primary battery LVD operation to extend the time of operation of the priority loads. Load distributions in systems without the secondary LLVD are all removed from circuit together at the battery LVD disconnect point.

Please refer to the specification of the system to determine which breakers are priority and non-priority loads (if optioned).

NOTE: make sure all incoming cables have adequate strain relief.

Figure 10: Load Connections

STEP 5: Connect the Batteries

Battery Common (+ve): All Battery Common connections are made to the connectors placed behind the Circuit breakers. 2 sizes of common terminals are available to accept cables up to 16mm² and 35mm².

Battery Live (-ve): Battery Live cables are connected directly to the terminals at the top of the circuit breakers. Battery breaker terminals are sized to accept cables up to 35mm².

NOTE: make sure all incoming cables have adequate strain relief.

Figure 11: Battery Connections

STEP 6: Affix the Battery Temperature Sensor

Uncoil and affix the battery temperature sensor in the centre of the middle battery string.

NOTE: The purpose of battery temperature sensor is to monitor the ambient temperature of the batteries over long periods of time and adjust the rectifier output (float) voltage accordingly.

NOTE: Refer to the specifications supplied by the battery vendor for battery operational temperature requirements.

STEP 7: Affix the Ambient Temperature Sensor (Optional)

Uncoil and affix the ambient temperature sensor in a position that will give an indication of average cabinet/room temperature.

NOTE: refer to the EM4x energy manager, RM3048HE Rectifier, SM2048HE Solar Converter manuals for information on the operational temperature limits.

STEP 8: Terminate External I/O Connections

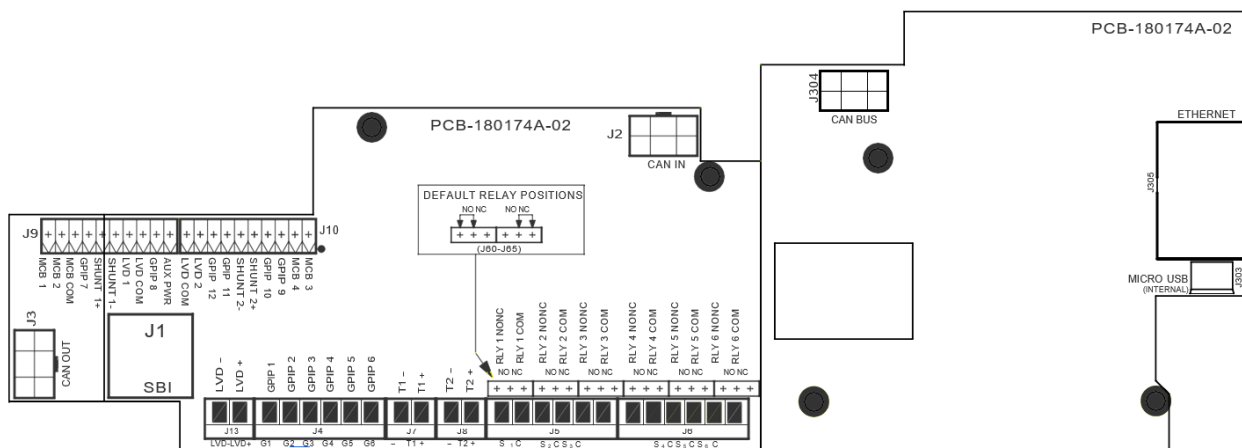

Terminate external I/O connections if any to the Energy manager. Refer to the EM4X Relay output and digital input sections for mappings in the EM4x Manual. The Monitor layout is as shown in **Figure 12**.

NOTE: The inputs are normally activated by connecting system positive (usually system common) to the input.

NOTE: Route and secure Alarm Extension Loom away from AC and DC cables

NOTE: For full EM4x functionality and operation information, refer to the EM4x Manual.

Figure 12: Controller Layout

6.5 Installing Breakers

When the FlexiCompact is provided without breakers this section describes how to install breakers into the system.

The FlexiCompact can utilize up to 12 or 18 load breakers of 6 to 63A and up to 4 battery circuit breakers of 80 to 125A maximum.

Product	
 <p>(Chint brand)</p>	Load MCB, 10A 6kA 1 Pole
	Load MCB, 20A 6kA 1 Pole
	Load MCB, 32A 6kA 1 Pole
	Load MCB, 40A 6kA 1 Pole
	Load MCB, 50A 6kA 1 Pole
	Load MCB, 63A 6KA 1Pole
	Battery MCB. 125A 6kA 1 Pole

The Enatel DC system provides for the battery circuit breakers to be placed on the left side of the DIN rail as numbered B1 to B4 in the Battery (-ve) section.

The load breakers can be installed in positions marked 1 to 12 in the Load Live (-ve) section of front connect systems and positions marked 1 to 18 in rear connect systems.

Figure 13: Breaker Sections on the DIN Rail

(Rear connect 18 load breaker variant shown)

1. Mount the battery breakers as required. One battery breaker for each string. See Figure 14.
 - a. Place the breaker on the bus pole.
 - b. Hook the breaker over the DIN rail
 - c. Tighten the battery circuit breakers in position using the bottom breaker screw.

Figure 14: Mounting a Battery Breaker

a.

c.

2. Mount the load breakers as required. See Figure 15.
 - a. Place the breaker on the bus pole.
 - b. Hook the breaker over the DIN rail.
 - c. Engage the breaker rear bottom blue clip with the bottom of the DIN rail.
 - d. Tighten the load breakers in position using the bottom breaker screw.

Figure 15: Mounting a Load Breaker

a.

d.

3. Separate the fuse fail detection wires from their wrapping. See Figure 16.

Figure 16: Fuse Fail Cable Wrapping

4. Install the fuse fail spade connectors. See Figure 17.
 - a. Insert the fuse fail spade connectors into the appropriate breakers.
 - b. Tighten the breaker fuse fail holder screw.

Figure 17: Insert the Fuse Fail Connector

The battery circuit breakers must be connected to the matching cables as noted in the following wiring guide. See Table 3.

Table 3: Battery Circuit Fuse Fail Wire Colour Guide

B1	
B2	
B3	
B4	

The load breakers can be connected to any fuse fail cable (there is no differentiation of load breaker open alarm).

5. Insulate each unused fuse fail connector appropriately. Bundle the unused fuse fail connectors using cable ties, stowing in the system away from potential bus bar contact.
6. Check all breakers are in the OFF position.

6.6 Rectifier Module Insertion and Removal

Figure 18: RM3048HE Front Panel

Rectifier modules are shipped separately. They must be plugged in to the system prior to power-up.

The rectifier modules are designed for "hot plug-and-play". It is safe to insert and remove modules at any time, even when the system is loaded.

The rectifier modules are self-addressing, meaning that no setup is required for the EM4x controller to determine rectifier addressing.

IMPORTANT: if a rectifier is removed from the system and then plugged into another rectifier slot, you **must** wait for the red LED to extinguish (this clears the address setting in the EPROM).

When inserting the module, ensure that it is pressed hard into the system. The locking button should click. See Figure 19.

Figure 19: Inserting a Rectifier

To remove the module press the locking button while pulling on the "handle" that is integrated into the front panel. See Figure 20.

Check that any blank rectifier slots have the rectifier blank panel inserted to prevent air back-flow.

Figure 20: Removing a Rectifier

6.7 Ventilation

Pay particular attention to the quality of rectifier air intake. Insects, sand, and other extraneous matter ingress seriously impacts the performance of the rectifiers.

The performance of the rectifier or other power modules can be limited if the ventilation is restricted. The rectifier is cooled by drawing air into the front of the unit with a single fan. This air passes through the rectifier cooling the electronics and exiting the rectifier at the rear. For efficient airflow:

- Check the air at the front of the rack is at ambient temperature and not being heated by other equipment.
- That the rectifier shelf has at least 75mm clear horizontal space behind it. This space must be clear of cables and any other components that may restrict air movement.
NOTE: if multiple rectifier shelves are installed then there should be at least 75mm clear horizontal space per shelf.
- Check the free space in the rack continues vertically to the exhaust point at the top of the rack, without impediment.

- Check the hot exhaust air does not re-circulate to the front of the rack as this will be drawn into the rectifiers again, in effect raising the apparent ambient temperature.
- Check the operating environment is low dust and fibre.

7 ENERGY MANAGER CONNECTIVITY AND THE WEB UI

The energy manager is configured via a web browser-based user interface (Web UI).

There are two methods to access the Web UI:

1. Ethernet connection from the J305 ethernet connector
2. Front panel micro-USB local connection

7.1 Access

There is 1 default access level for the energy manager Web UI:

enaadvanced : this user has full control access of the system

The default password = **W7h!GJ28KG**

NOTE: it is strongly recommended that the default access level has its password changed on commissioning.

7.2 Ethernet Port Connection

The energy manager contains static sensitive components that require careful handling and proper precautions to be taken – an electrostatic discharge protection device must be worn.

Figure 21: Energy Manager Ethernet Port

Ethernet Port

1. Connect the communicating device to the J305 Ethernet port inside the energy manager.
2. Open an internet browser such as Edge, Chrome, Firefox or similar on the device.
3. Enter the Ethernet default IP address into the internet browser.

NOTE: the energy manager IP address can be located from the front panel LCD menu under: Settings>Networking>Ethernet.

4. The energy manager log in page appears.

enatel

Username

Password

Details are always encrypted on send.

Login

5. Enter the user name and password. See [7.1 Access](#).

7.3 USB Connection

Figure 22: 3U EM4x-01 Front Panel micro-USB

1. Connect the communicating device to the micro-USB port on the front of the energy manager. See Figure 22.

A driver installation prompt appears.

 Enatel Linux Products USB Installer (32-bit)	20/05/2018 9:46 PM	Windows Installer ...	1,188 KB
 Enatel Linux Products USB Installer (64-bit)	20/05/2018 9:46 PM	Windows Installer ...	1,556 KB

2. Double-click the appropriate USB driver (32bit or 64 bit).
3. Follow the installation wizard instructions to install the driver.
4. Open an internet browser such as Edge, Chrome, Firefox or similar.
5. Enter the USB default IP address into the internet browser: **172.31.250.1**
6. The energy manager log in page appears.

7. Enter the username and password. See [7.1 Access](#).

Note: USB connection to the energy manager is possible without AC, battery or other external power supply. The EM4x operates drawing power through the USB port. However USB supply does not power the IO Board. In this scenario there is a set of alarms that display depending on the system configuration relating to the non-operation of the IO board.

For example:

- Relay Logic Error
- IOBoard 1 Missing
- Battery Temperature Faulty
- Ambient Temperature Low
- Input and Relay...
- IO Board
- Battery
- General Alarms

For information on the use of the energy manager Web UI please refer to the Energy Manager Installation and Operation Manual.

7.4 Energy manager & IO PCB Alarm Output Configuration

For full EM4x functionality and operation information, refer to the EM4x Installation and Operation Manual.

7.4.1 EM4x LED Alarm Mappings

Refer to the Alarm Configuration>Alarm Configuration page of the Web UI to see the priority setting of each alarm.

Refer to the Relay/Output page Configure Relay section of the Web UI to understand the how the Alarm Configuration is mapped to the EM4x LEDs.

OR

OR

(For reference only. Actual system alarm mapping may vary)

7.4.2 EM4x Main PCB Alarm Mappings

Alarms can be mapped to any of the voltage free output relays fitted to the EM4x. Output states of either Normally Open or Normally Closed can be selected (NO and NC states are for the de-energised relay). A jumper is fitted to nominate the required output state, ensure the jumper is placed in the correct configuration for installation requirements.

If an alarm is programmed for the relay to be normally energised (such as a low voltage alarm where loss of power will put the alarm into its “active” state), then be sure to connect the remote wiring appropriately.

Table 4 lists alarm assignment for the EM4x controller as matches the relay outputs shown in Figure 23.

Figure 23: EM4x Relay Outputs

Table 4: IO Board 1 Relay Alarm Assignments

Relay Output	Relay Label (in Enatel Config.)	Alarms Mapped to Relay/Output (all multiple states "OR-ed")
Relay 1	CPU Fail	
Relay 2	Non-Critical Alarms	Orange LED
Relay 3	Critical alarms	Red LED
Relay 4	Spare	
Relay 5	Spare	
Relay 6	Spare	
Buzzer		Red LED

7.4.3 EM4x Main PCB Digital Input Alarm Mappings

General purpose inputs allow the FlexiCompact system to monitor any external equipment that includes relay or auxiliary outputs. The GPI inputs are activated by connecting the system positive (common) to the input terminal (configuration setup in the EM4x can allow activation by connecting to system live).

General purpose inputs can also be configured as analogue inputs for purposes such as battery midpoint monitoring and voltage monitoring.

These inputs may be assigned to contribute to alarm states within the monitor. The state mapping is defined in the configuration file. Alarm mapping should be completed using the EM4x software. Please refer to the EM4x manual for detailed information.

The inputs are normally activated by connecting system positive (usually system common) to the input.

7.4.4 Circuit Breaker Fail Monitoring

Comment: Load circuit breakers are monitored electronically via a diode to a digital input on the EM4x. The digital input will trigger an alarm when it is pulled to the system common (positive) rail. The Breaker Fail alarm will only operate if a load is connected to the output to provide a return circuit for the sense wire. Therefore, for breakers that do not have a load connected, the breaker can remain in an **OFF** position without causing a false alarm.

The battery circuit breakers however, use voltage sense to detect tripping or whether they are turned off. This is because when a battery breaker is tripped, there may be very little voltage difference across the breaker, making electronic fail detection problematic. Hence, if no battery is connected, the breaker must be **ON** to clear the Battery Breaker Fail alarm.

8 LVD OPERATION

The primary Low Voltage Disconnect contactor is located in the battery side of the DC distribution. A secondary Load Low Voltage Disconnect can be optionally included in a section of the load side of the DC distribution.

The LVD contactor is a bi-stable, magnetically latching contactor. This means that failure of power or removal of the EM4x from a live system will not cause the contactor to change state. Periodic pulsing of the LVD control signal allows the monitor to ensure the contactor remains in the correct state. The contactor is monitored by the EM4x to allow an alarm to be generated when the contactor is open.

The EM4x energy manager unit is powered from both the rectifier side of the LVD contactor and direct from the battery source. Following an extended AC outage and the low output voltage threshold being reached, the primary LVD disconnects the battery from the system live bus and the EM4x will lose voltage sense (as voltage sense is measuring system live bus voltage) yet still maintains operation for system monitoring. The LVD contactor will not re-engage until rectifier input supply is restored (i.e., until the DC bus voltage is re-established). LVD adjustments/settings are all made in the supervisory module. Please refer to the SEM4x manual for detailed setup information.

9 MAINTENANCE

As Enatel power systems are state of the art electronic systems, little routine maintenance is required.

9.1 System

- During normal operation the cable entries to the MCBs may loosen over time due to movement in the cable strands. To avoid damage to the MCB's and cable entries due to heat build-up and arching, it is recommended that the retaining torque is periodically checked at least annually.
- MCB's should be maintained at a torque of 2Nm.
- All other connections should also be checked at this time.

9.2 EM4x Controller

- The controller can give a good indication of the condition of the system. Alarm logs can show issues with the system and rectifiers and should be regularly checked.
- As a minimum, check that the float voltage and load current is as expected.
- If the batteries are fully charged, check the battery current is zero or near to zero amps, and also check that the amp-hours remaining is 100%.

9.3 Rectifiers

- During normal operation some dust will build-up on the front of the rectifiers. This should be kept to a minimum by regularly wiping the rectifiers to avoid accumulation within the rectifiers and blocking the airflow to the units. The positioning of the system and surroundings will determine the regularity of this requirement.

- In extremely dusty positions it is recommended that the units are removed and cleaned with compressed air to prevent airflow blockages.
- Check the air flow front and back to the rectifiers is unimpeded by cables or otherwise.
- Check nothing has entered the rectifiers such as insects or geckos.

9.4 Batteries

- Battery maintenance depends on the individual manufacturer's specification, please contact the battery supplier for recommendations.
- Periodic discharge tests may be beneficial to ensure reliable system operation and may be recommended by the battery manufacturer.

CAUTION The user must be aware of the consequences of battery State of Health (SoH) with regards their specific load requirements and implement their own policy regards the end of life of the batteries.

9.5 Ventilation Maintenance

Check that there has been no change in the required airflow space or environment that impacts the ventilation. Refer to [6.7 Ventilation](#) for the required details.

10 TROUBLE-SHOOTING AND SERVICING

If the red 🔔 LED is alight:

- Unplug the rectifier and re-engage.
- Check AC power to the rectifier.
- Check for rectifier alarms in the monitor Urgent Alarm list.
- If symptoms persist, contact a service agent.

If the yellow 🔔 LED is alight:

- Check the monitor Non-Urgent Alarm list.

10.1 Servicing

DANGER Do not operate the rectifiers, converters or other power modules if the covers are damaged or removed in any way.

WARNING The rectifiers, converters or other power modules contain voltages that may be lethal even after the input supply has been removed.

WARNING The rectifiers, converters or other power modules contain components at high temperature that may burn if touched

To isolate a rectifier or converter from the power supply, unplug it from the shelf.

The power modules contain no user serviceable components. Do not disassemble the modules.

If a power module has an operational fault or is damaged in any way, an authorised service centre should service it immediately.

11 ENATEL ESSENTIAL SYSTEM SET-UP PARAMETERS

The following steps are system settings that must be checked at the time of commissioning for each system installed. You can print this section and fill it out for each site commissioned.

NOTE: these steps are battery chemistry dependent. Follow the appropriate section.

11.1 Systems with Lead Acid Batteries

Failure to correctly follow the items below may cause incorrect system functionality and in some cases ruin your battery (without the ability to claim battery replacement under warranty).

NOTE: Any values shown below are indicative only. If the values in your system differ from those shown here, write in the values relevant to your system.

Refer to the EM4x energy manager manual for more details.

11.1.1 Check the Battery Type

The system **MUST** be configured to the correct battery type.

EM4x Web UI page: [Battery>Battery Settings](#)

Battery Type

Lead Acid

Basic Li

Energypak

Modular Li

Done ☐

11.1.2 Check/Set Float Voltage

Consult battery manufacturer's data for proper setting.

The Float voltage is for 25°C reference temperature in Enatel systems.

EM4x Web UI page: [Control](#)

Example:

Float Voltage

54

V

Site Setting:

Float Voltage

V

Done ☐

11.1.3 Set Battery Temperature Compensation

Toggle temperature compensation On.

EM4x Web UI page: [Battery>Battery Settings](#)

Rectifier Compensation

On

Off

You **must** consult the battery manufacturer's data to obtain the correct Slope setting. Note that in many Hybrid applications where the battery is constantly being cycled, having temperature compensation enabled may not be necessary as the voltage on the battery is constantly changing anyway.

EM4x Web UI page: [Battery>Battery Settings](#)

Example:

Maximum Temperature	55	°C	↺	✓
Minimum Temperature	0	°C	↺	✓
Number Of Cells	24	cells	↺	✓
Temperature Slope	-3	mV/°C/cell	↺	✓

Site Settings:

Maximum Temperature		°C	↺	✓
Minimum Temperature	0	°C	↺	✓
Number Of Cells		cells	↺	✓
Temperature Slope		mV/°C/cell	↺	✓

Done ☐

If you choose **not** to enable Temperature Compensation, then set the Rectifier Float Voltage to that required by the battery manufacturer for the average long-term temperature you anticipate your system to operate at.

11.1.4 Set Battery Capacity

Consult the battery manufacturer's data for correct battery capacity settings.

For the EM4x to set the correct Battery Current Limit current, it is essential that this is filled out correctly. These figures are also used for estimating the Battery Time Remaining during a discharge.

For Telecom applications, the 10 hour rate is usually the name-plate rating of the battery. However, once again, check the battery manufacturer's data sheets as some manufacturers state the 20 hour rate (which is usually a little more "optimistic").

The second rate is required specifically for the time-remaining algorithm. A 4 hour rate is usually a good one to use. This information is available from the battery manufacturer's data sheet.

The Battery SoC adjust can be used at the time of installation (or for testing purposes) in case the installed battery is not initially fully charged. If you think the battery is only 80% charged, then simply enter that value. The value displayed here will correct itself once the battery has been on charge for some time or gone through a few charge/discharge cycles.

Battery Recharge Efficiency considers the ohmic and any other losses in the battery charge/discharge cycle. The effect is that more energy (Ah) needs to be put back into the battery than was taken out. With the efficiency set to 96%, then 4% more Ah is needed to be returned to the battery before the EM4x will register that the battery is at 100% SoC.

The Battery Discharge Threshold is a buffer to prevent false triggering of discharge notification and is usually related to the size of the battery shunt. A larger shunt requires a larger discharge threshold.

EM4x Web UI page: [Charge](#)

Example:

10h Rate Battery Capacity	650	Ah	↺	✓
Secondary Capacity Rate Time	4	h	↺	✓
Secondary Capacity	500	Ah	↺	✓
Battery Recharge Efficiency	96	%	↺	✓
Battery State Of Charge	64.5	%	↺	✓
Battery Discharge Threshold	-3	A	↺	✓

Site Settings:

10h Rate Battery Capacity		Ah	↺	✓
Secondary Capacity Rate Time		h	↺	✓
Secondary Capacity		Ah	↺	✓
Battery Recharge Efficiency		%	↺	✓
Battery State Of Charge		%	↺	✓
Battery Discharge Threshold		A	↺	✓

Done ☐

NOTE: Both the 10 hour and secondary battery capacity hour rates should be set at the same time. The EM4x compares rates to ensure the battery data is accurate and may not accept the setting if an inaccuracy is detected.

11.1.5 Set Battery Current Limit

Consult battery manufacturer's data for maximum battery recharge current settings.

The Battery Current Limit is set as a percentage of the 10 hour rate entered above.

It is recommended this value is set at the highest rate allowable to ensure the battery is recharged as fast as possible.

In some systems, especially larger systems, this may require limiting further because of the number of rectifiers available, rather than the maximum setting.

EM4x Web UI page: [Battery>Battery Settings](#)

Enable Battery Current Limit by clicking on the tick icon beside the field.

Battery Charge Current Limit	<input checked="" type="checkbox"/>	Disabled	%	↺	✓
------------------------------	-------------------------------------	----------	---	---	---

Example:

Battery Charge Current Limit	<input checked="" type="checkbox"/>	20	%	↺	✓
------------------------------	-------------------------------------	----	---	---	---

Site Settings:

Battery Charge Current Limit	<input checked="" type="checkbox"/>		%	↺	✓
------------------------------	-------------------------------------	--	---	---	---

Done ☐

For telecom settings, this limit is often set to 10% (or 0.1C10, i.e. a 10A current limit for a 100Ahr battery). This is more typical of a design parameter than the need for the setting to be at this level but a setting higher than this

level should be considered to enable the fastest recharge possible without exceeding the battery manufacturer's maximum value.

Ensure sufficient rectifier capacity is available to cover battery recharge and load requirements.

11.1.6 Low Voltage Disconnect Settings

The LVD disconnect set points are usually a customer generated setting.

As the discharge time increases, the higher the end voltage should be set. For a discharge of <1hr, this may be as low as 1.75Vpc (42.0V for a "48V" battery), or for an 8 hour discharge, it may be 1.85Vpc (44.4V for a "48V" battery).

Note that if only one LVD is fitted (as is the case in all of the Enatel microCOMPACT systems, LVD2 and LVD3 thresholds are set outside of possible tripping voltages. This avoids any confusion over which LVD signal is being used by the EM4x energy manager.

EM4x Web UI page: [IO Configuration>IO Boards](#)

Toggle LVD latching On

LVD Latching

On Off

Example:

LVD1 Disconnect	43	V	↺	✓

LVD3 Disconnect		V	↺	✓
LVD3 Reconnect		V	↻	✓

Done ☐

11.2 DC System Lead Acid Battery Commissioning Check-List

This section is for a more detailed commissioning process than the Essential Set-up Parameters. It may be printed out separately and filed for record keeping.

DC System Lead Acid Battery Commissioning Check-List

Site Name: _____ Date: _____

Tests Without Batteries Connected	Value	Results
Check Float Voltage	Meter: _____	_____ V ✓ / ✗
Check Load Current	Meter: _____	_____ A ✓ / ✗

Alarms

Voltage thresholds can either be checked using an external power supply, or by adjusting the EM4x float voltage 0.1V above (or below for the low voltage alarms). It is recommended to have the batteries **disconnected**.

1. Adjust the supply/float voltage to 55.7V & observe the "High Float" alarm.
2. Adjust the supply/float voltage to 57.7V & observe the "High Load" alarm.
3. Adjust the supply/float voltage to 52.7V & observe the "Low Float" alarm.
4. Adjust the supply/float voltage to 46.9V & observe the "Low Load" alarm.

High Load Volts (urgent)	57.6V	_____ V	✓ / ✗
High Float Volts (non-urgent)	55.6V	_____ V	✓ / ✗
Low Float Volts (non-urgent)	52.8V	_____ V	✓ / ✗
Low Load Volts (urgent)	47.0V	_____ V	✓ / ✗

Depending on the test load available, it may be necessary to adjust the High Load Current alarm threshold down to suit. For example, with 40A test load, adjust the Load Current High Setpoint threshold (Web UI page Alarm Configuration>System Alarms) to 35A. Then simply apply the 40A load and observe the alarm change state.

Once the test is complete, be sure to rest the Load Current High Setpoint to its previous value (or check with the customer for the correct value they require).

Load Current High Setpoint	_____ A	✓ / ✗
----------------------------	---------	-------

Temperature alarm tests are performed by heating up (using a heat gun or other source) and cooling down (using an aerosol can of freeze, or a tub of ice) the temperature sensors.

Battery Temperature High (urgent)	_____ °C	✓ / ✗
Battery Temperature Low (non-urgent)	_____ °C	✓ / ✗
Room Temperature High (non-urgent)	_____ °C	✓ / ✗
Room Temperature Low (non-urgent)	_____ °C	✓ / ✗

When an AC Monitoring PCB is not fitted at system level (as in most cases), the AC Fail alarm is generated from the rectifiers. The rectifiers sense if AC is present, and extend an AC fail alarm to the EM4x. Therefore, to test this alarm, simply turn off the rectifier AC breakers. To allow the controller to continue to read alarms there must be DC present on the output of the system.

As this causes the rectifier output to cease, a Rectifier Fail alarm is also generated. To generate the Urgent Rectifier Fail, turn off the required number to make this

occur (usually set to 2, but check via the EM4x Web UI for the setting (Control page>Rectifier Urgent Fail Threshold).

AC Fail (urgent)	Urgent	✓ / ✗
Rectifier Fail (non-urgent)	Non-urgent	✓ / ✗
Urgent Rectifier Fail (urgent)	No. Modules:_____	✓ / ✗

To check Load MCB fail, connect a load, but with no load turned on. Then switch the breaker to its off position, and turn on some load (any amount will do). This will cause the alarm to occur as the load side to the circuit will be taken to system common voltage. Turn off the load, and then return the breaker to its on position.

Load MCB Fail (urgent)		✓ / ✗
------------------------	--	-------

Tests with Batteries

- Turn off Battery Breaker/s
- Connect battery/batteries
- Check the correct Battery Capacity (Ahrs) has been entered (EM4x Web UI Battery>Battery Settings). This is the total capacity, so for example 100Ahr strings in parallel, this should be 200.
- Go to EM4x Web UI Battery>Battery Settings>Battery Charge Current Limit. Check Battery Charge Current Limit (BCL) is set to desired level (usually $0.25C_{10}$, (25%)). This means that for a single 100Ahr battery, the BCL will be 25A, or if two 100Ahr batteries are connected in parallel, the BCL will be 50A.
- Connect load (but turn off).
- Check V_f is set to 54.0V. (Web UI Control>Float Voltage)
- Turn on Battery Breaker/s

Check Battery current is positive if charging		✓ / ✗
---	--	-------

For systems fitted with Battery Monitoring (BCM) cards:

Go to EM4x Web UI Battery>Battery Status. Check cell voltages are approximately the same, at about 2.25V (or 13.5V for 12V monoblocs).

✓ / ✗

If any are out by a large amount, then check the BCM sense wiring is correct.

Set load to required level (e.g., 30A), Initiate a Battery Test.	Check operates	✓ / ✗
---	----------------	-------

Click the Start Battery Test button on EM4x Web UI Charge page.

Check Battery Current is negative (discharging). Note the overview data in the header of the Web UI.		✓ / ✗
--	--	-------

Check Battery Current	Meter:_____ A	✓ / ✗
-----------------------	---------------	-------

After several minutes, or until the battery voltage has dropped below approx. 47V,
click the Stop button at the top of the Web UI Charge page.
During this time the Battery Condition Monitor (if fitted) is logging.

Battery Current Limit (BCL)

Check that the battery recharge current is limited to the Battery Current Limit level (usually $0.25C_{10}$, (25%)). See Web UI Battery Settings>Calculated Charge Current Limit for Amp value.	BCL functions _____%	✓ / ✗
--	-------------------------	-------

Note: as the BCL is based on fine voltage control of the system bus, the BCL make take one or two minutes to "settle", i.e., you

may observe a brief excursion of the battery recharge current beyond the BCL setting.

Check Manual Equalise (if configured). Click the Start Manual Equalise button on the Charge page to initiate a battery equalisation. Click the Stop button at the top of the Charge page to end. ✓ / ✕

A Battery MCB Fail alarm is generated from the voltage measured across the battery MCB.

Therefore, to check a Battery MCB Fail alarm, simply open one of the battery MCB's. If batteries are connected to the system at this time, the alarm may take a few moments to activate. Once test is complete, turn breaker back on.

Battery MCB Fail (urgent) ✓ / ✕

Temperature Compensation

Check Temperature Compensation is enabled. ✓ / ✕

Web UI Battery>Battery Settings>Rectifier Compensation>On.

Apply heat or cold to the Battery Temperature Sensor/s. Check the float voltage moves up or down as expected. ✓ / ✕

If actual measurement is required, apply a known heat or cold to the sensor. Allow it to fully come to temperature and record the amount of voltage movement. Temp. _____ °C
Voltage offset: _____ V OK? ✓ / ✕

Check Alarm Relay Contacts

To generate these alarms, refer to the procedures described earlier in the Commissioning Check-list.

Spare relays will not be able to be tested unless an alarm is mapped to them. As these are tested in the factory, it is not essential to test them at time of commissioning.

On main EM4x PCB

Relay 1 (Monitor Fail) ✓ / ✕
(pull out the RJ45 lead connecting the monitor to the system rectifier shelf – this simply de-powers the monitor)

Relay 2 (Summary Non-urgent) ✓ / ✕

Relay 3 (Summary Urgent) ✓ / ✕

Relay 4 (Spare) ✓ / ✕

Relay 5 (Spare) ✓ / ✕

Relay 6 (Spare) ✓ / ✕

NOTE: Prior to leaving the system after it has been commissioned, check all AC, DC and battery circuits are off. If it is required that the system is to be left on (to power load equipment, ensure rectifiers are left in their powered up state, and batteries are in circuit. This will prevent anyone leaving the batteries only powering the load (in which case the batteries go flat).

11.3 Systems with Lithium Batteries

The term lithium batteries includes a wide range of chemistry types. Regardless of the chemistry used the energy manager differentiates lithium (and other non-lead acid batteries) by whether the battery BMS can be communicated to via Modbus RTU or not. These 'smart' batteries are termed modular, where the energy manager is receiving information on alarms and status from the battery internal electronics.

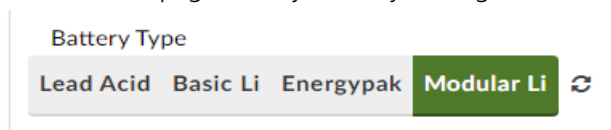

Failure to correctly follow the items below may cause incorrect system functionality and in some cases ruin your battery (without the ability to claim battery replacement under warranty).

NOTE: Any values shown below are indicative only. If the values in your system differ from those shown here, write in the values relevant to your system.
Refer to the EM4x energy manager manual for more details.

11.3.1 Check the Battery Type

The system **MUST** be configured to the correct battery type.

EM4x Web UI page [Battery>Battery Settings](#)

Done ☐

11.3.2 Modular Smart Lithium Battery Selection

If the system is connected via Modbus RTU to a battery BMS check the correct specific battery is selected from the **Product** drop down list and mapped to the correct address.

EM4x Web UI page: [IO Configuration>Modbus Master>Device Map](#)

Done ☐

11.3.3 Check/Set Float Voltage

Consult the battery manufacturer's data for the proper setting. Note that the float voltage directly impacts the state of health of batteries after multiple cycles. The consequences of the float voltage setting **must** be understood.

The Float voltage is for 25°C reference temperature in Enatel systems.

Appendix I RECTIFIER FUSE AND FRONT PANEL BEHAVIOUR

I.A Rectifier Input Fuse Characteristics

The Enatel RM3048HE rectifier uses two Conquer UDA-A 025 fuses in its input, one in the phase and one in the neutral circuit.

NOTE: The curves are for average value, for reference only.

Figure 24: Rectifier Input Fuse Tripping Curves

I.B RM3048HE Front Panel Indications

There are three LED indicators on the front panel to indicate the operational state of the rectifier.

This green LED indicates that input power is connected to the unit and that the primary stages of the rectifier are operating.

This yellow LED indicates a non-urgent alarm/notification state within the rectifier.

This could be caused by the following:

- rectifier in output power/current limit
- rectifier over temperature
- fan failed
- rectifier soft starting

This red LED indicates an urgent alarm state within the rectifier.

This could be caused by the following:

- rectifier failed
- the AC input voltage is outside the operating range.
- rectifier shut down due to output over-voltage or over-temperature.

Appendix II AC INPUT TRANSIENT PROTECTION

Information to assist the installer for AC input protection is detailed in this section.

Illustration A: Surge Protection Installation

Illustration A shows the surge protection installation principles, utilising the 3 stage protection zone concept.

The **Type 1** (SPD1) surge arrester, fitted in the installation's main incoming electrical switchboard, is capable of diverting the energy of a direct lightning strike. This is the first stage of the electrical network's protection. It is important that upstream Type 1 protection is provided on site. Although the actual surge capability of the device used can vary depending on the severity of lightening in any particular installation, the typical maximum discharge current of a Type 1 surge suppressor will be in the order of 50kA to 100kA (10/350µs impulse)

The 10/350µs current wave as shown below is the standardized current waveform which passes through equipment when subjected to an overvoltage due to a direct lightning strike.

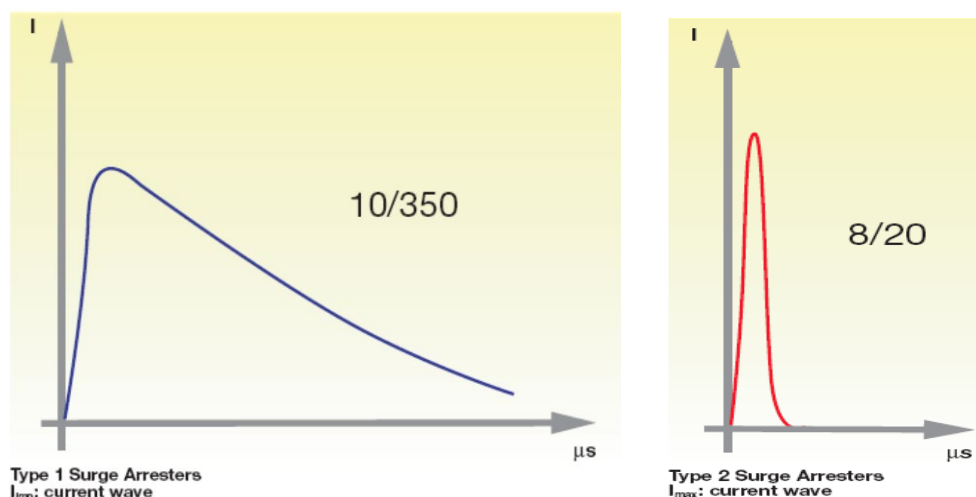

Illustration B: Surge Protection Types

A **Type 2** surge arrester (SPD2) should be used in coordination with the incoming **Type 1** surge arrester. This is the second stage of protection. The Type 2 Surge arrester is designed to run-off energy caused by an overvoltage comparable to that of an indirect lightning strike or an operating overvoltage (this is effectively the "left-over" surge from the Type 1 protection device). To provide sufficient de-coupling between the Type 1 and Type 2 devices, impedance is required. This is typically stated to be 10m of cable (approximately 10µH). This cable may be looped if the distance available is too short. Alternatively, various manufacturers have devices which act as

filter elements or provide active spark ignition for applications where 10m of cable is not practical (such as outdoor enclosures).

Note: Enatel Rectifiers are compliant with EN61000-4-5, Level 4 without any external/upstream surge suppression. To maintain a coordinated approach to surge suppression, Type 2 SPD should be installed upstream if not fitted in the system.

WARNING The fitment of a Type 2 AC Surge Suppression Device is mandatory.
If a Type 2 SPD is NOT fitted, the warranty is void.

II.A Upstream Over-Current Protection

There are three considerations to take into account when selecting an appropriate fuse/circuit breaker:

- Firstly, the upstream protection should protect the downstream cable from overload situations,
- Secondly, discrimination should be maintained with the downstream device fuses, and
- Thirdly, protection of the surge suppression devices should be taken into account.

II.B Cable Rating

The maximum current drawn by this DC power system is 52.5A per phase (at minimum input voltage of 185V Ph-Ph and full output power). The upstream protection device must be able to supply this load under all conditions without tripping. Therefore, typically at least 20% headroom is allowed for in the protection device, making its minimum rating 63A. As a result, typically 63A device is used. Therefore, the cable used to supply the system must be rated at the upstream protection device rating. Please see your local wiring regulations for exact requirements, as cable sizes can vary depending on these regulations and on the material the cable's insulation is made from.

As a comment on rectifier AC feed cable sizes: each rectifier is fed by one set of cables from the AC input terminals. Although in theory it may appear that this smaller wire is unprotected, in fact it is protected on two accounts. Firstly, it is protected by the rectifier input fuse (which is only a short distance away). Secondly, the rectifiers are power-limited on their input. Therefore, they can never be overloaded. As a result, the wire can never be over-loaded by the rectifier – it can only see fault current.

II.C Discrimination

Discrimination ensures that the upstream circuit breaker or fuse does not blow if a rectifier input is faulty (in a short circuit manner). Therefore, it is important to ensure the upstream protection discriminates with the internal fuse of the rectifier. The fuse used in the RM3048HE is a slow-blow 25A fuse.

Preferably use either a 50A, D-curve, or a 63A, C or D curve breaker. If a fuse is used upstream, then any BS88 or NH g style fuse will discriminate above 50A. A minimum circuit breaker to use for this system is a 50A.

II.D Surge Suppression Device Protection

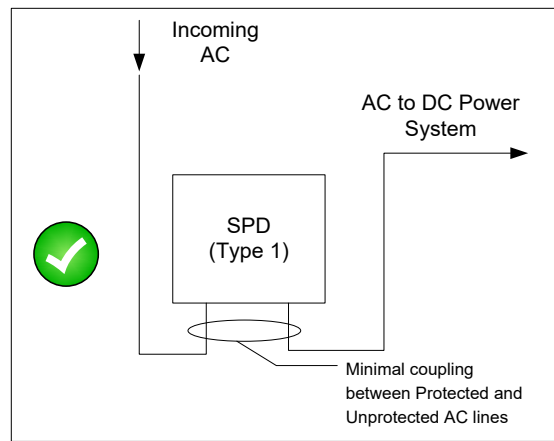

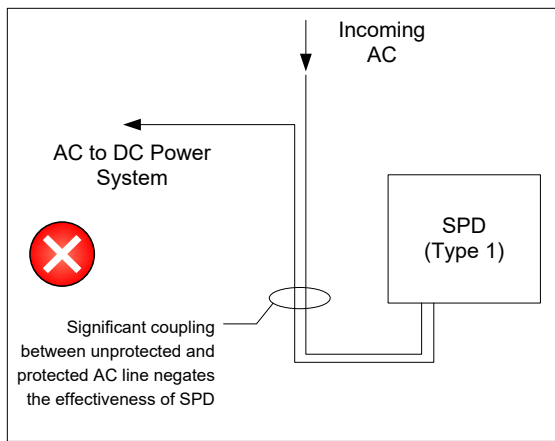

It is recommended to have Type 2 Surge Protection Devices (s) (as defined by IEC 61643-11) upstream to the supplied cabinet. These devices are rated for repeated strikes of 20kA (8/20µs waveform), and single shot protection of 40kA.

It is important that upstream Type 1 protection is also provided on site. To ensure correct operation of the s, at least 10m of AC feeder cable is fitted between the Type 1 and Type 2 protection. If the distance between the AC incoming distribution board and the DC Power System is less than 10m, then loop the cable until at least 10m of cable is used. This ensures correct de-coupling of the devices.

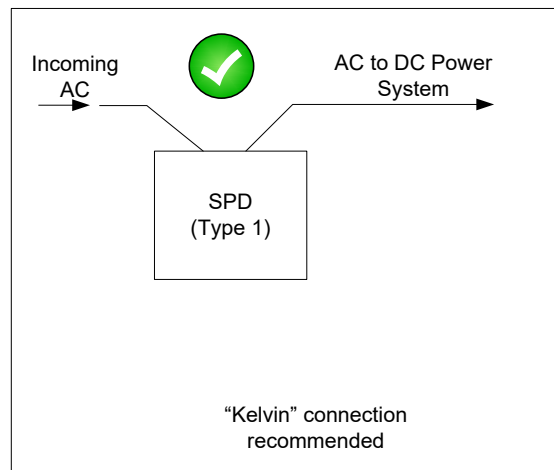

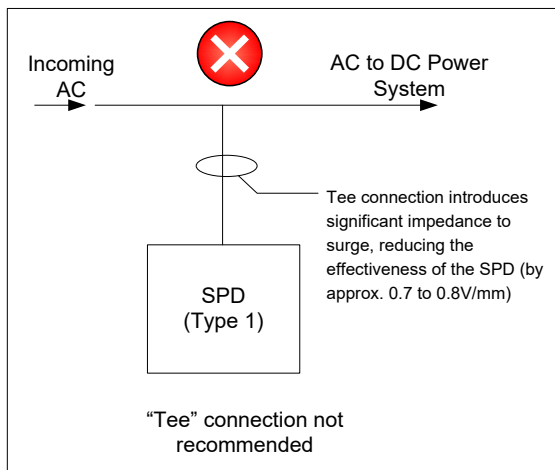

II.E AC cable installation and surge protection

The following precautions MUST be adhered to when installing AC cabling.

1. Avoid running input and output cables from AC Surge Protection Devices together:

2. Avoid "T" Connections:

Appendix III ENATEL ENERGY STANDARD LIMITED WARRANTY POLICY

Enatel warrants that its products shall be free from defects of material or workmanship under use consistent with correct installation and commission, normal operation, product specifications, Enatel's written instructions, and regional standards compliance, for a period of one (1) year from the start date. The start date shall be defined as (a) the date the product is shipped from Enatel's factory; or (b) in the case of resale by an authorized Enatel reseller, whichever is the lesser of i) the date on the sales invoice or ii) ninety (90) days after original shipment by Enatel factory.

The warranty provides for repairing or replacing, at Enatel's sole discretion, those products deemed defective by Enatel after inspection of its products returned by the customer to the factory or other Enatel authorized location within the warranty period. Replaced product provided by Enatel under the terms of this warranty does not extend the original warranty, replacement product assumes the warranty of the original product. Repaired product or component thereof has a warranty period of ninety (90) days or the remainder of the unexpired term of the original product warranty, whichever is greater.

III.A Warranty Exclusions and Restrictions

Products or parts may be excluded from warranty coverage for reasons including, but not limited to: if the hardware or software has been altered or repaired by an unauthorized party; is defective due to misuse, negligence, accident, mechanical damage, improper installation or maintenance; inappropriate on-site conditions such as high humidity, dust, power surges, out-of-range temperatures, animal or insect damage, water or other liquid damage; where serial numbers or identification marks are removed or defaced in any way; Force Majeure event; has cosmetic shortcomings which do not affect normal operation; inappropriate electrical stress; for suspected fraud or abuse of Enatel's warranty policy; the account has breached or is in dispute of Enatel's commercial terms and conditions.

Note Enatel warranty does not cover data loss, regular back-ups to separate storage is required.

III.B Battery Warranty

Battery warranty is NOT covered under this warranty. Where Enatel supplies batteries a separate warranty statement shall govern the battery warranty, or where an Enatel battery warranty is not provided the authorized battery vendor's warranty shall be assigned to the batteries.

Note that batteries' operational limits are typically more constrained than Enatel manufactured equipment, need specific care during storage and maintenance, and requirements typically vary for each battery type and vendor. Enatel product warranty is voided should improper care of associated batteries be the cause of product defect.

Unless stated otherwise in the terms and conditions of sale warranty for peripherals, attachments or apparatus not manufactured by Enatel shall be excluded from this warranty.

III.C Initiating a Warranty Claim

To make a warranty claim please complete a Request for RMA Number form:

<https://www.enatel.net/support/#rma/>

Issuance of an RMA number means your RMA request has been approved and the product or part warranty claim may now be managed as instructed by Enatel.

Shipping Defective Product to Enatel: All shipments must be shipped prepaid and include proof of the date of your original purchase along with the RMA number of the approved RMA clearly indicated with the shipment – see the Request for RMA Number form for further details.

Note Enatel will pay the cost of shipping replacement or repaired units from warranty claims from Enatel back to the customer, only, unless otherwise approved by Enatel during the RMA Number application process.

III.D Disclaimer

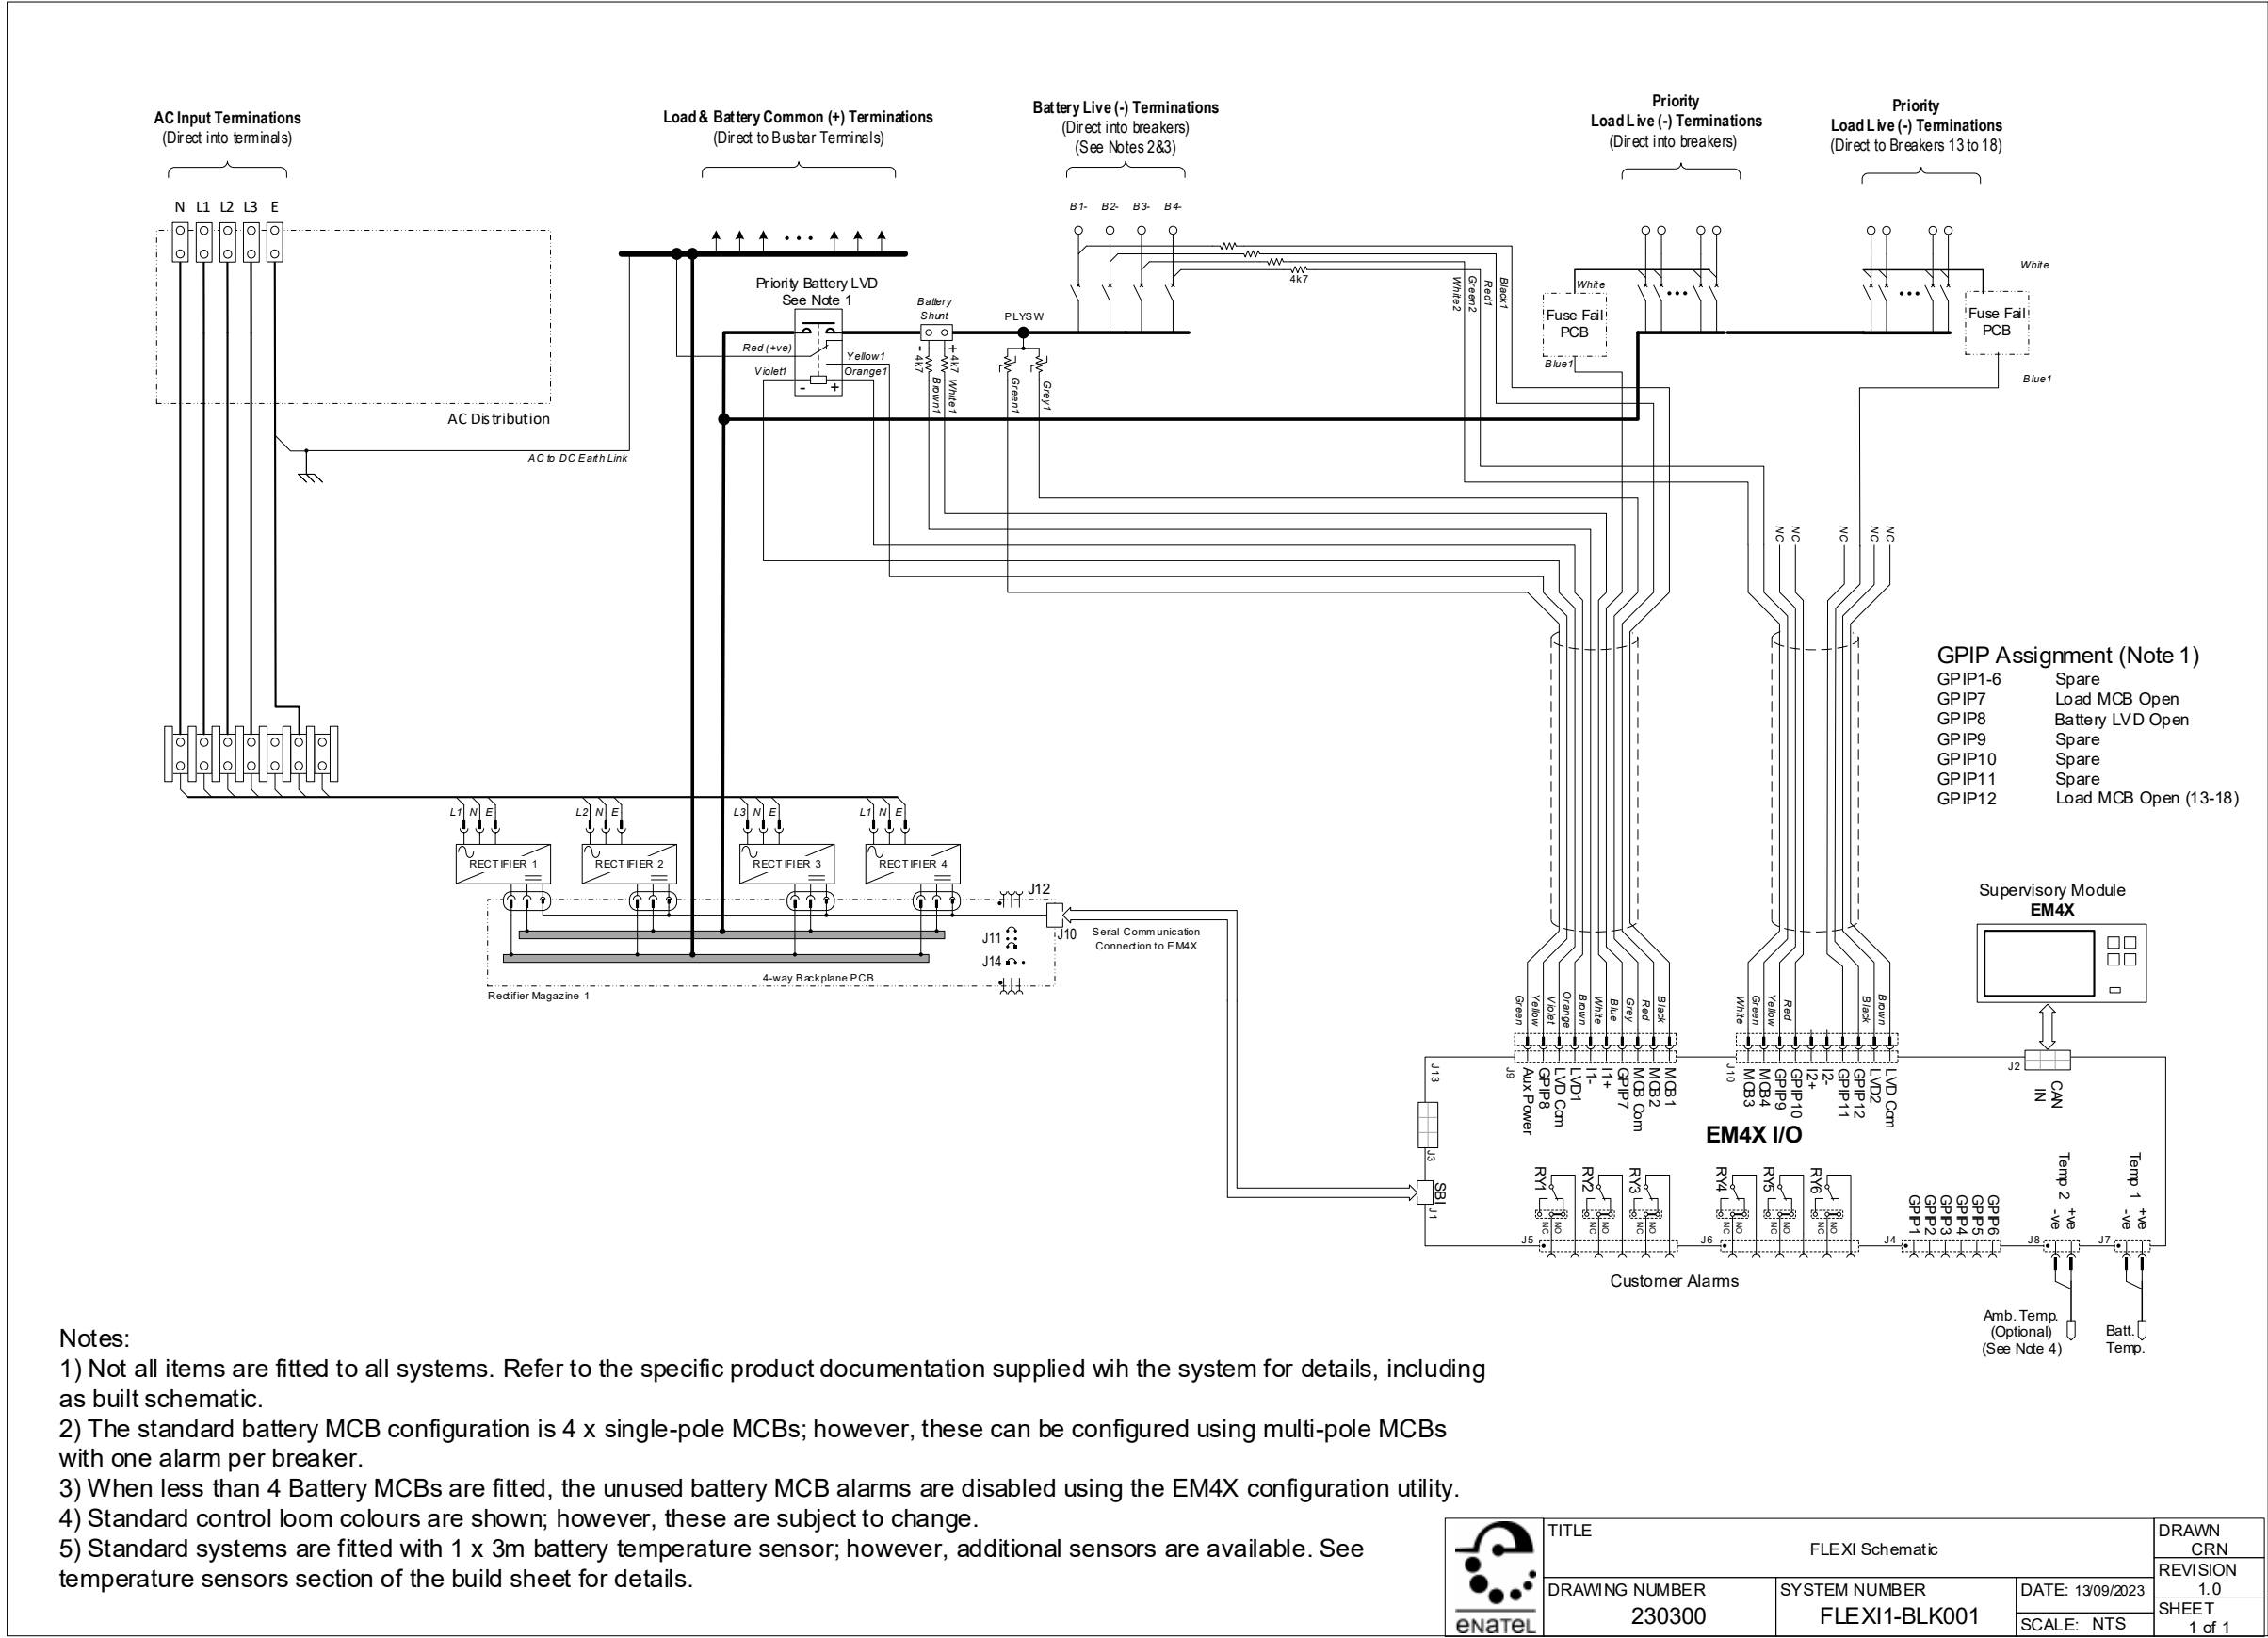

Enatel's warranties and remedies set forth above are exclusive and in lieu of all other warranties, remedies and conditions, whether oral or written, express or implied. Enatel specifically disclaims any and all implied warranties, including but not limited to warranties of merchantability and fitness for a particular purpose. In no event shall Enatel be responsible for indirect or consequential damages or lost profits even in the case of negligence and if Enatel has been advised of the possibility of such damages. Enatel's sole obligation shall be the repair or replacement of a non-conforming product. In no case shall Enatel's liability under this warranty exceed the value of the unit provided. If the law prohibits Enatel from disclaiming implied warranties or warranties of merchantability, all such warranties are limited to the greatest extent permitted by law. Enatel reserves the right to change the information detailed within this statement without notice.

The benefits conferred by these warranties are in addition to other rights you may have depending on your country, state or province of residence. Furthermore, some countries, states and provinces do not allow the exclusion or limitation of incidental or consequential damages or exclusions or limitations on the duration of implied warranties, so the above limitations or exclusions may not apply to you. If any provision of these warranties is unlawful, void or unenforceable, that provision shall be deemed severable and shall not affect any remaining provisions. This warranty shall be governed by and interpreted in accordance with the laws of New Zealand.

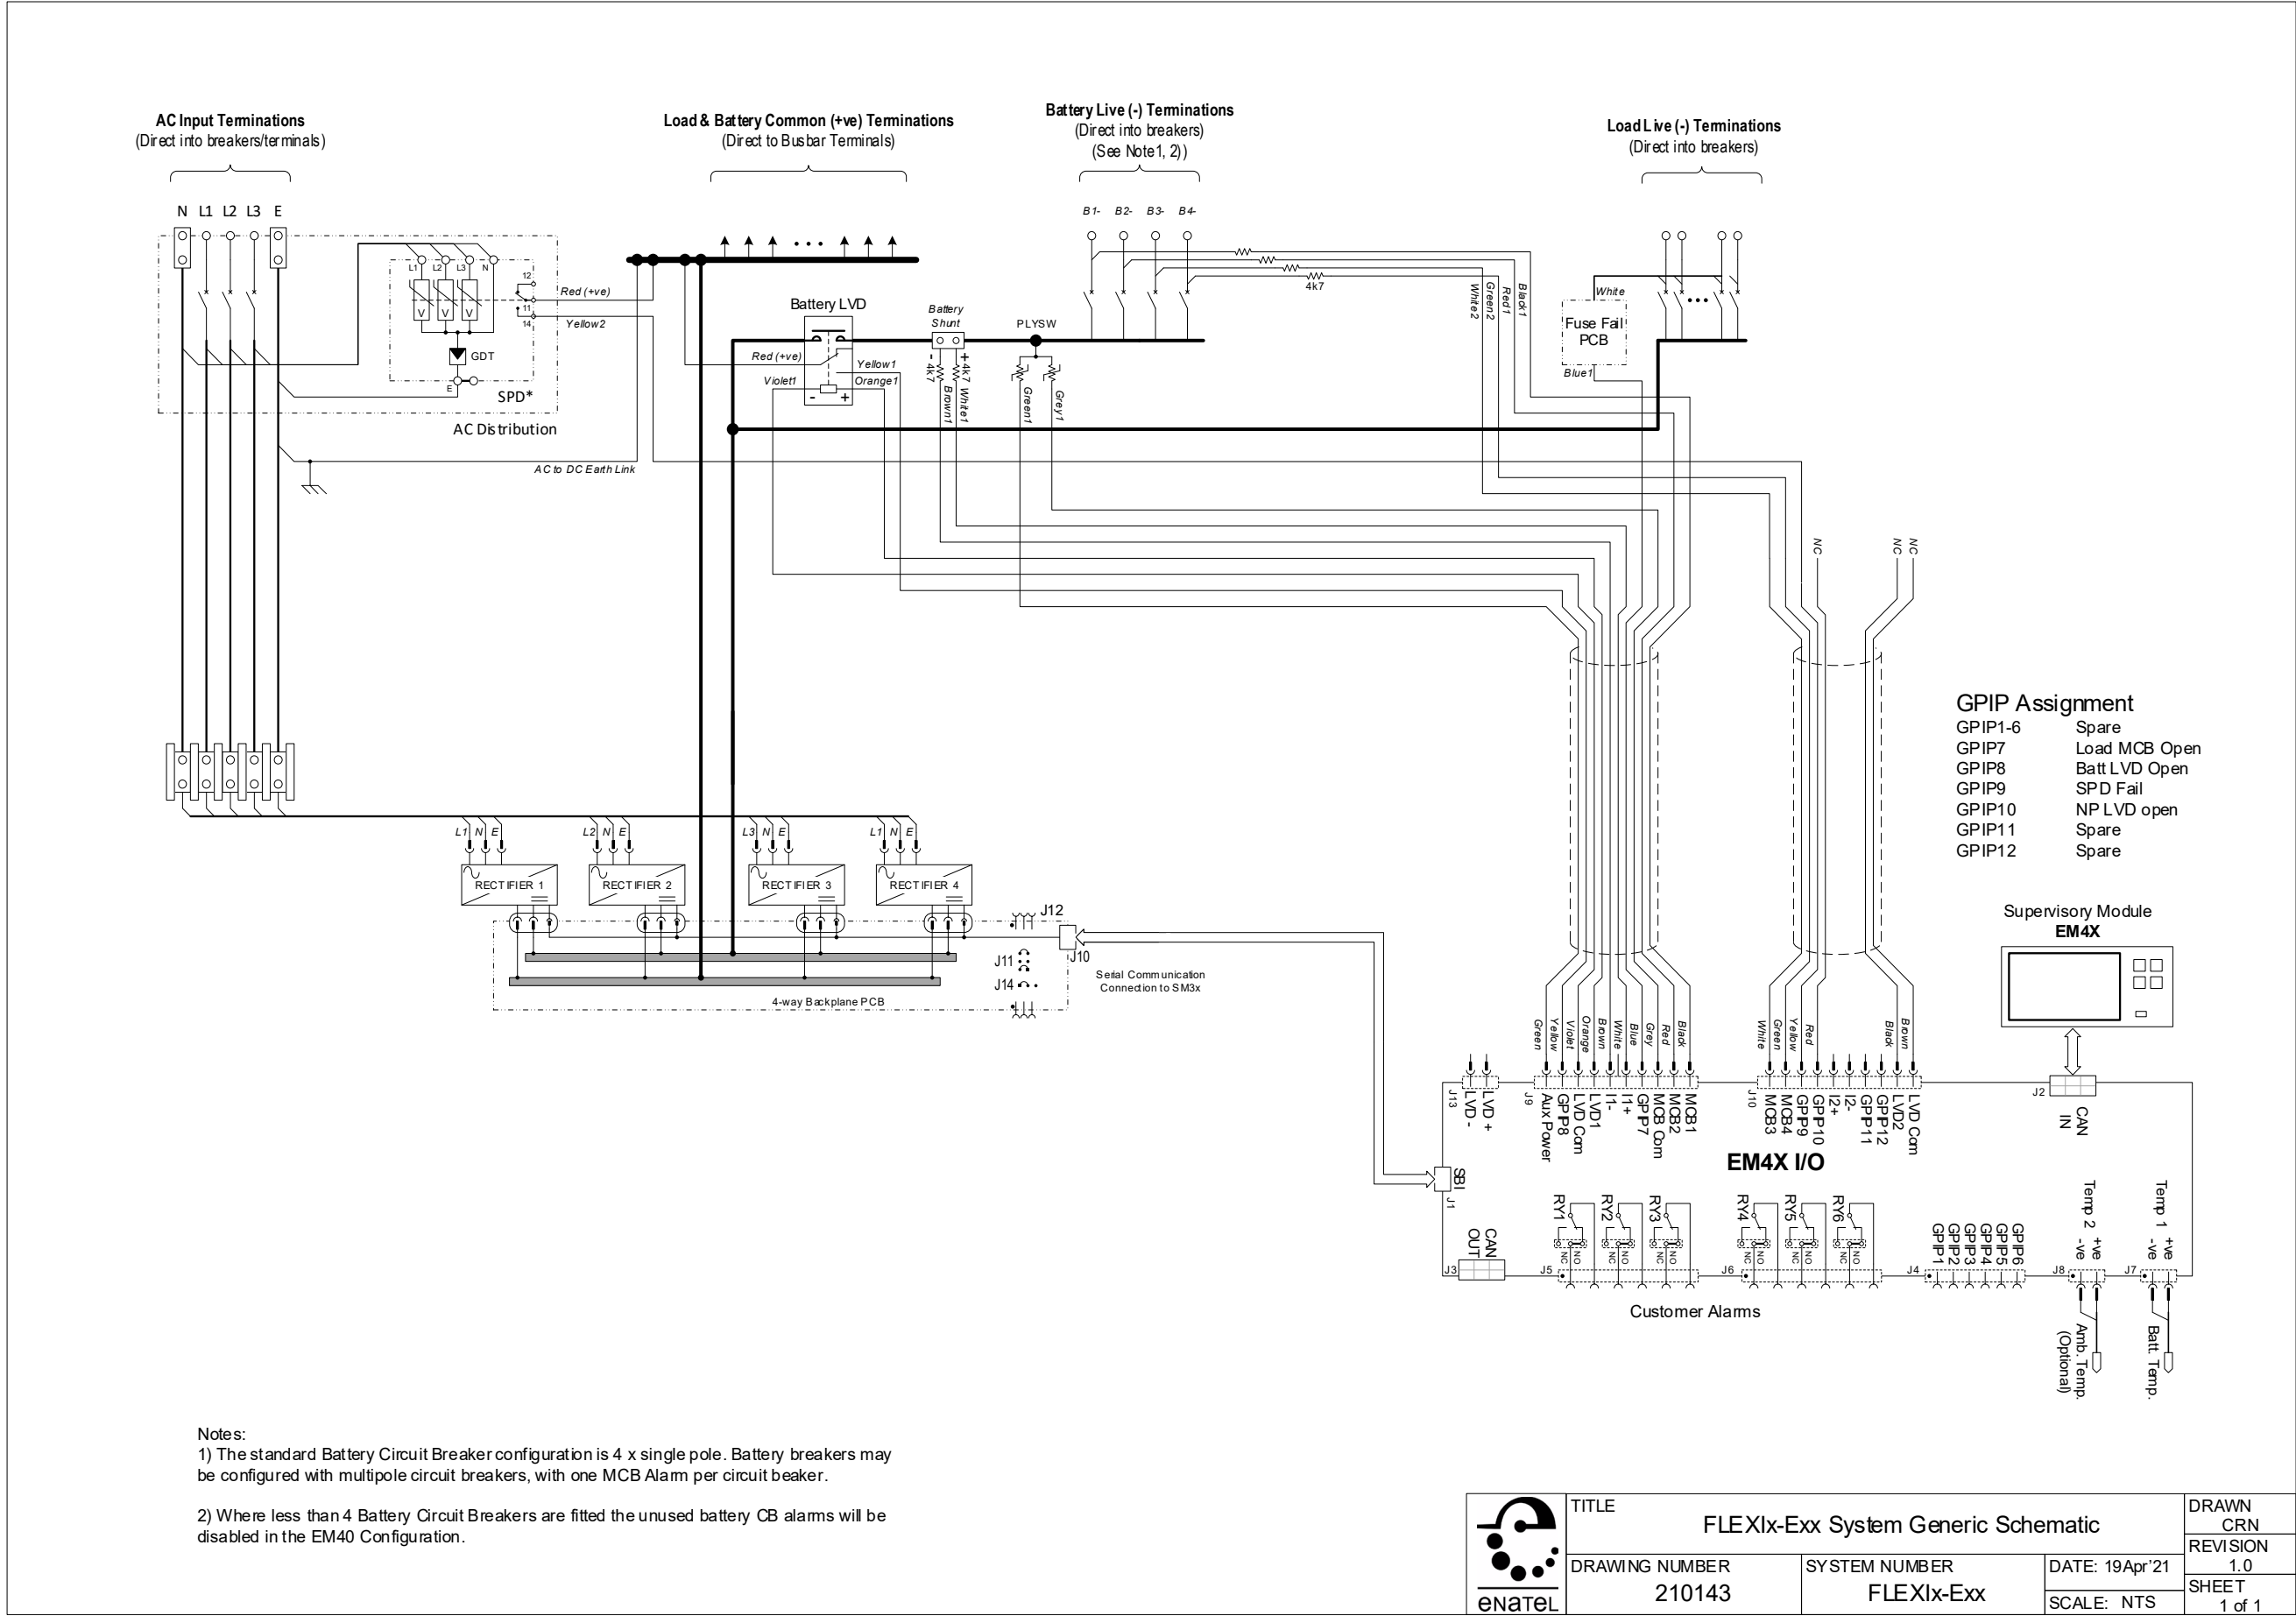

III.E Remark

Enatel is a registered company name. New Zealand Company Number: 1202388

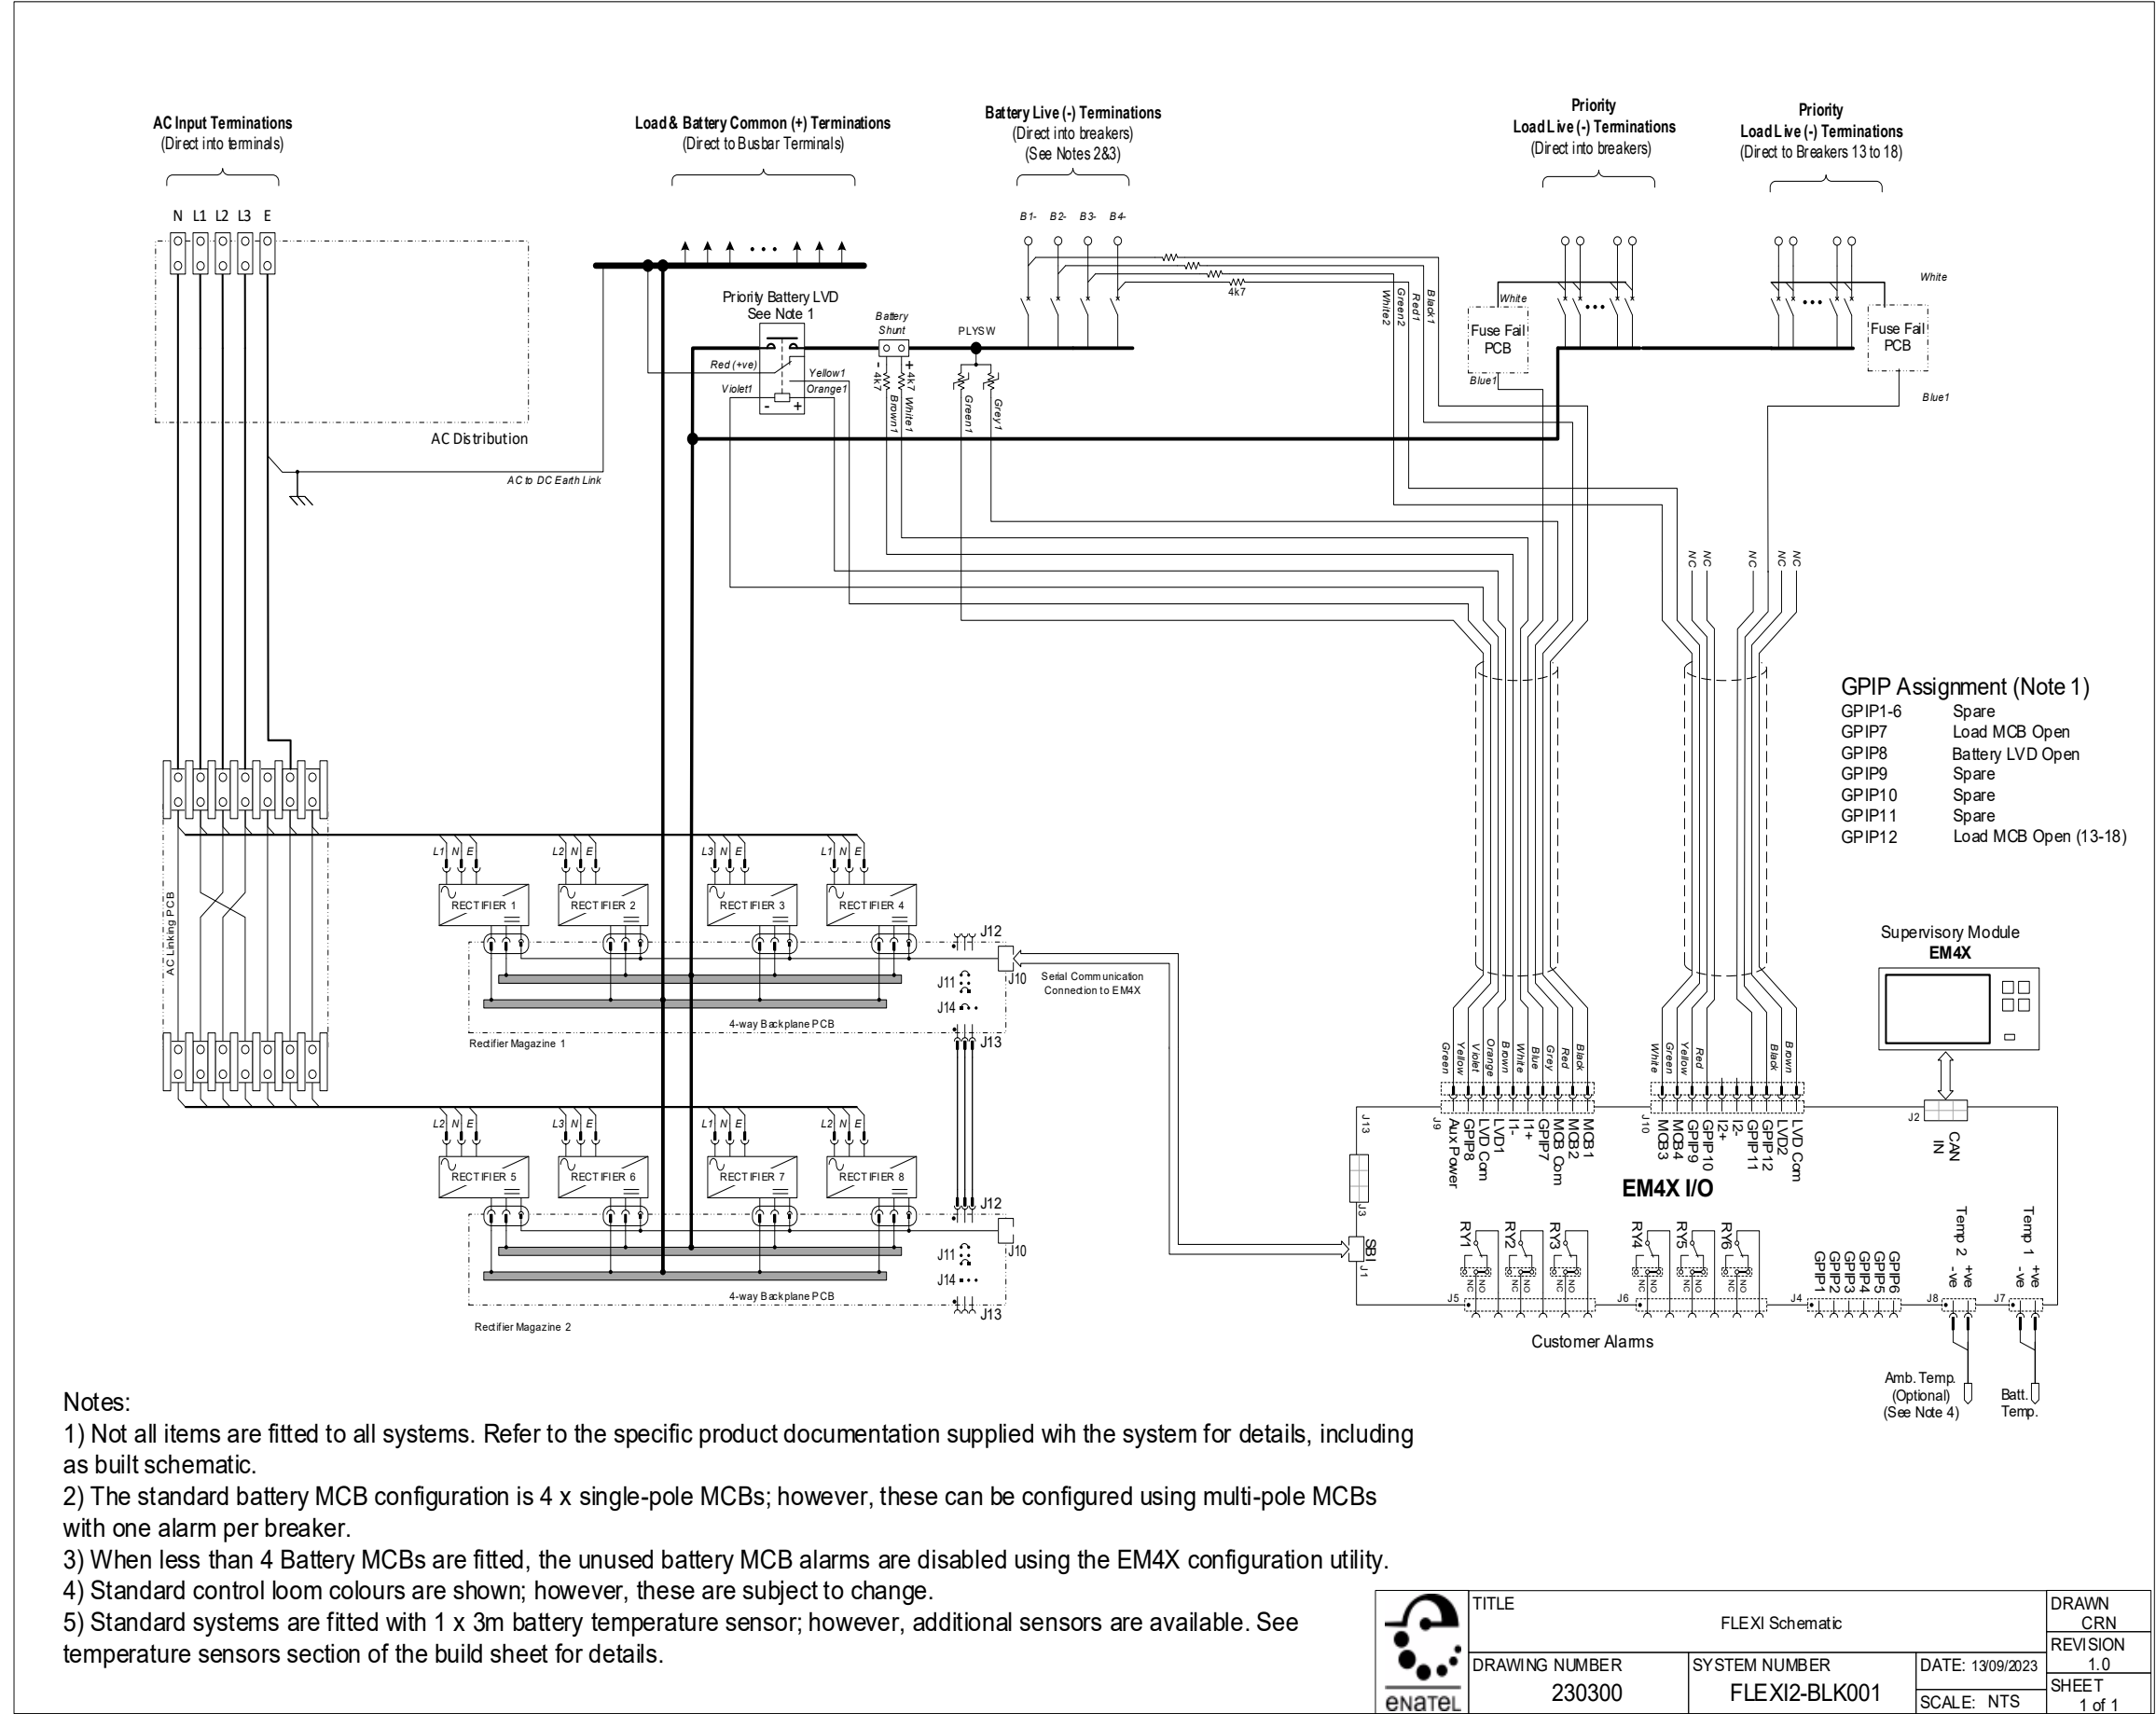

Appendix IV SYSTEM SCHEMATIC
IV.A FLEXI1-BLK001 Schematic

IV.B FLEXI1-BLK002 Schematic

IV.C FLEXI2-BLK001 Schematic

- Notes:
- 1) Not all items are fitted to all systems. Refer to the specific product documentation supplied with the system for details, including as built schematic.
 - 2) The standard battery MCB configuration is 4 x single-pole MCBs; however, these can be configured using multi-pole MCBs with one alarm per breaker.
 - 3) When less than 4 Battery MCBs are fitted, the unused battery MCB alarms are disabled using the EM4X configuration utility.
 - 4) Standard control loom colours are shown; however, these are subject to change.
 - 5) Standard systems are fitted with 1 x 3m battery temperature sensor; however, additional sensors are available. See temperature sensors section of the build sheet for details.
